COVER LETTER

Dear StackAdapt Hiring Team,

I am applying for the Engineering Manager I, Applications role because its focus on delivery discipline, operational health, technical review, and documentation closely intersects with the systems I design and operate. My experience combines modest-scale production operations for live clients, automation governance, electrical-infrastructure coordination, and direct responsibility for two operating businesses.

I designed and operate an original, risk-graded multi-agent workflow that routes work among Claude Opus, Claude Sonnet, and Codex according to defined roles and review requirements. Separately, I designed and operate the Pantheon automated pipeline that produced two applications under my direction and formal review gates. Its three-gate protocol includes security checks, race-condition tests, seed-integrity validation, and accessibility testing. These systems have required explicit decision boundaries, durable run logs, structured review, and careful separation of design, implementation, and approval responsibilities.

I also operate Auretris and Kuanli for two live clients. Auretris uses n8n workflows to answer prospective-student questions and route leads, while Kuanli is a customized and operated fork of an open-source CRM. The deployment uses Docker Compose, self-hosted Supabase and PostgreSQL, hand-written row-level-security migrations, and Ollama inference. Its public Auretris repository contains a sanitized architecture and operations overview; production workflows, credentials, client data, and deployment configuration remain private.

At InfiSol Technical Services, I coordinated field teams during installation and commissioning, produced AutoCAD pathway and routing designs, completed material take-offs, and performed drawing QA for telecom and fiber-infrastructure work across Vancouver, rural Alberta, and Vancouver Island. My UBC Electrical Engineering degree and EGBC Engineer-in-Training credential reinforce the documentation and technical discipline behind that work. I am also completing an MBA, expected in 2027.

This position is a significant stretch: I have not held a formal people-management role, and my active cloud experience is limited to Cloudflare rather than AWS. I also do not have demonstrated Kubernetes or Terraform experience. I would nevertheless bring grounded production-operations experience, technical governance, client accountability, and cross-team coordination. I would welcome the opportunity to discuss whether that foundation could meet StackAdapt's needs while I develop the platform-specific depth the role requires. Thank you for your consideration.

Sincerely,

Pratham Goel
